

Visuospatial Biases as a Window Into Embodied Cognition

Andriy Myachykov

(andriy.myachykov@northumbria.ac.uk)

1. SIMULATED COGNITION
2. VISUOSPATIAL BIASES IN KNOWLEDGE REPRESENTATIONS
3. INTERACTIONS BETWEEN CO-ACTIVATED REPRESENTATIONS

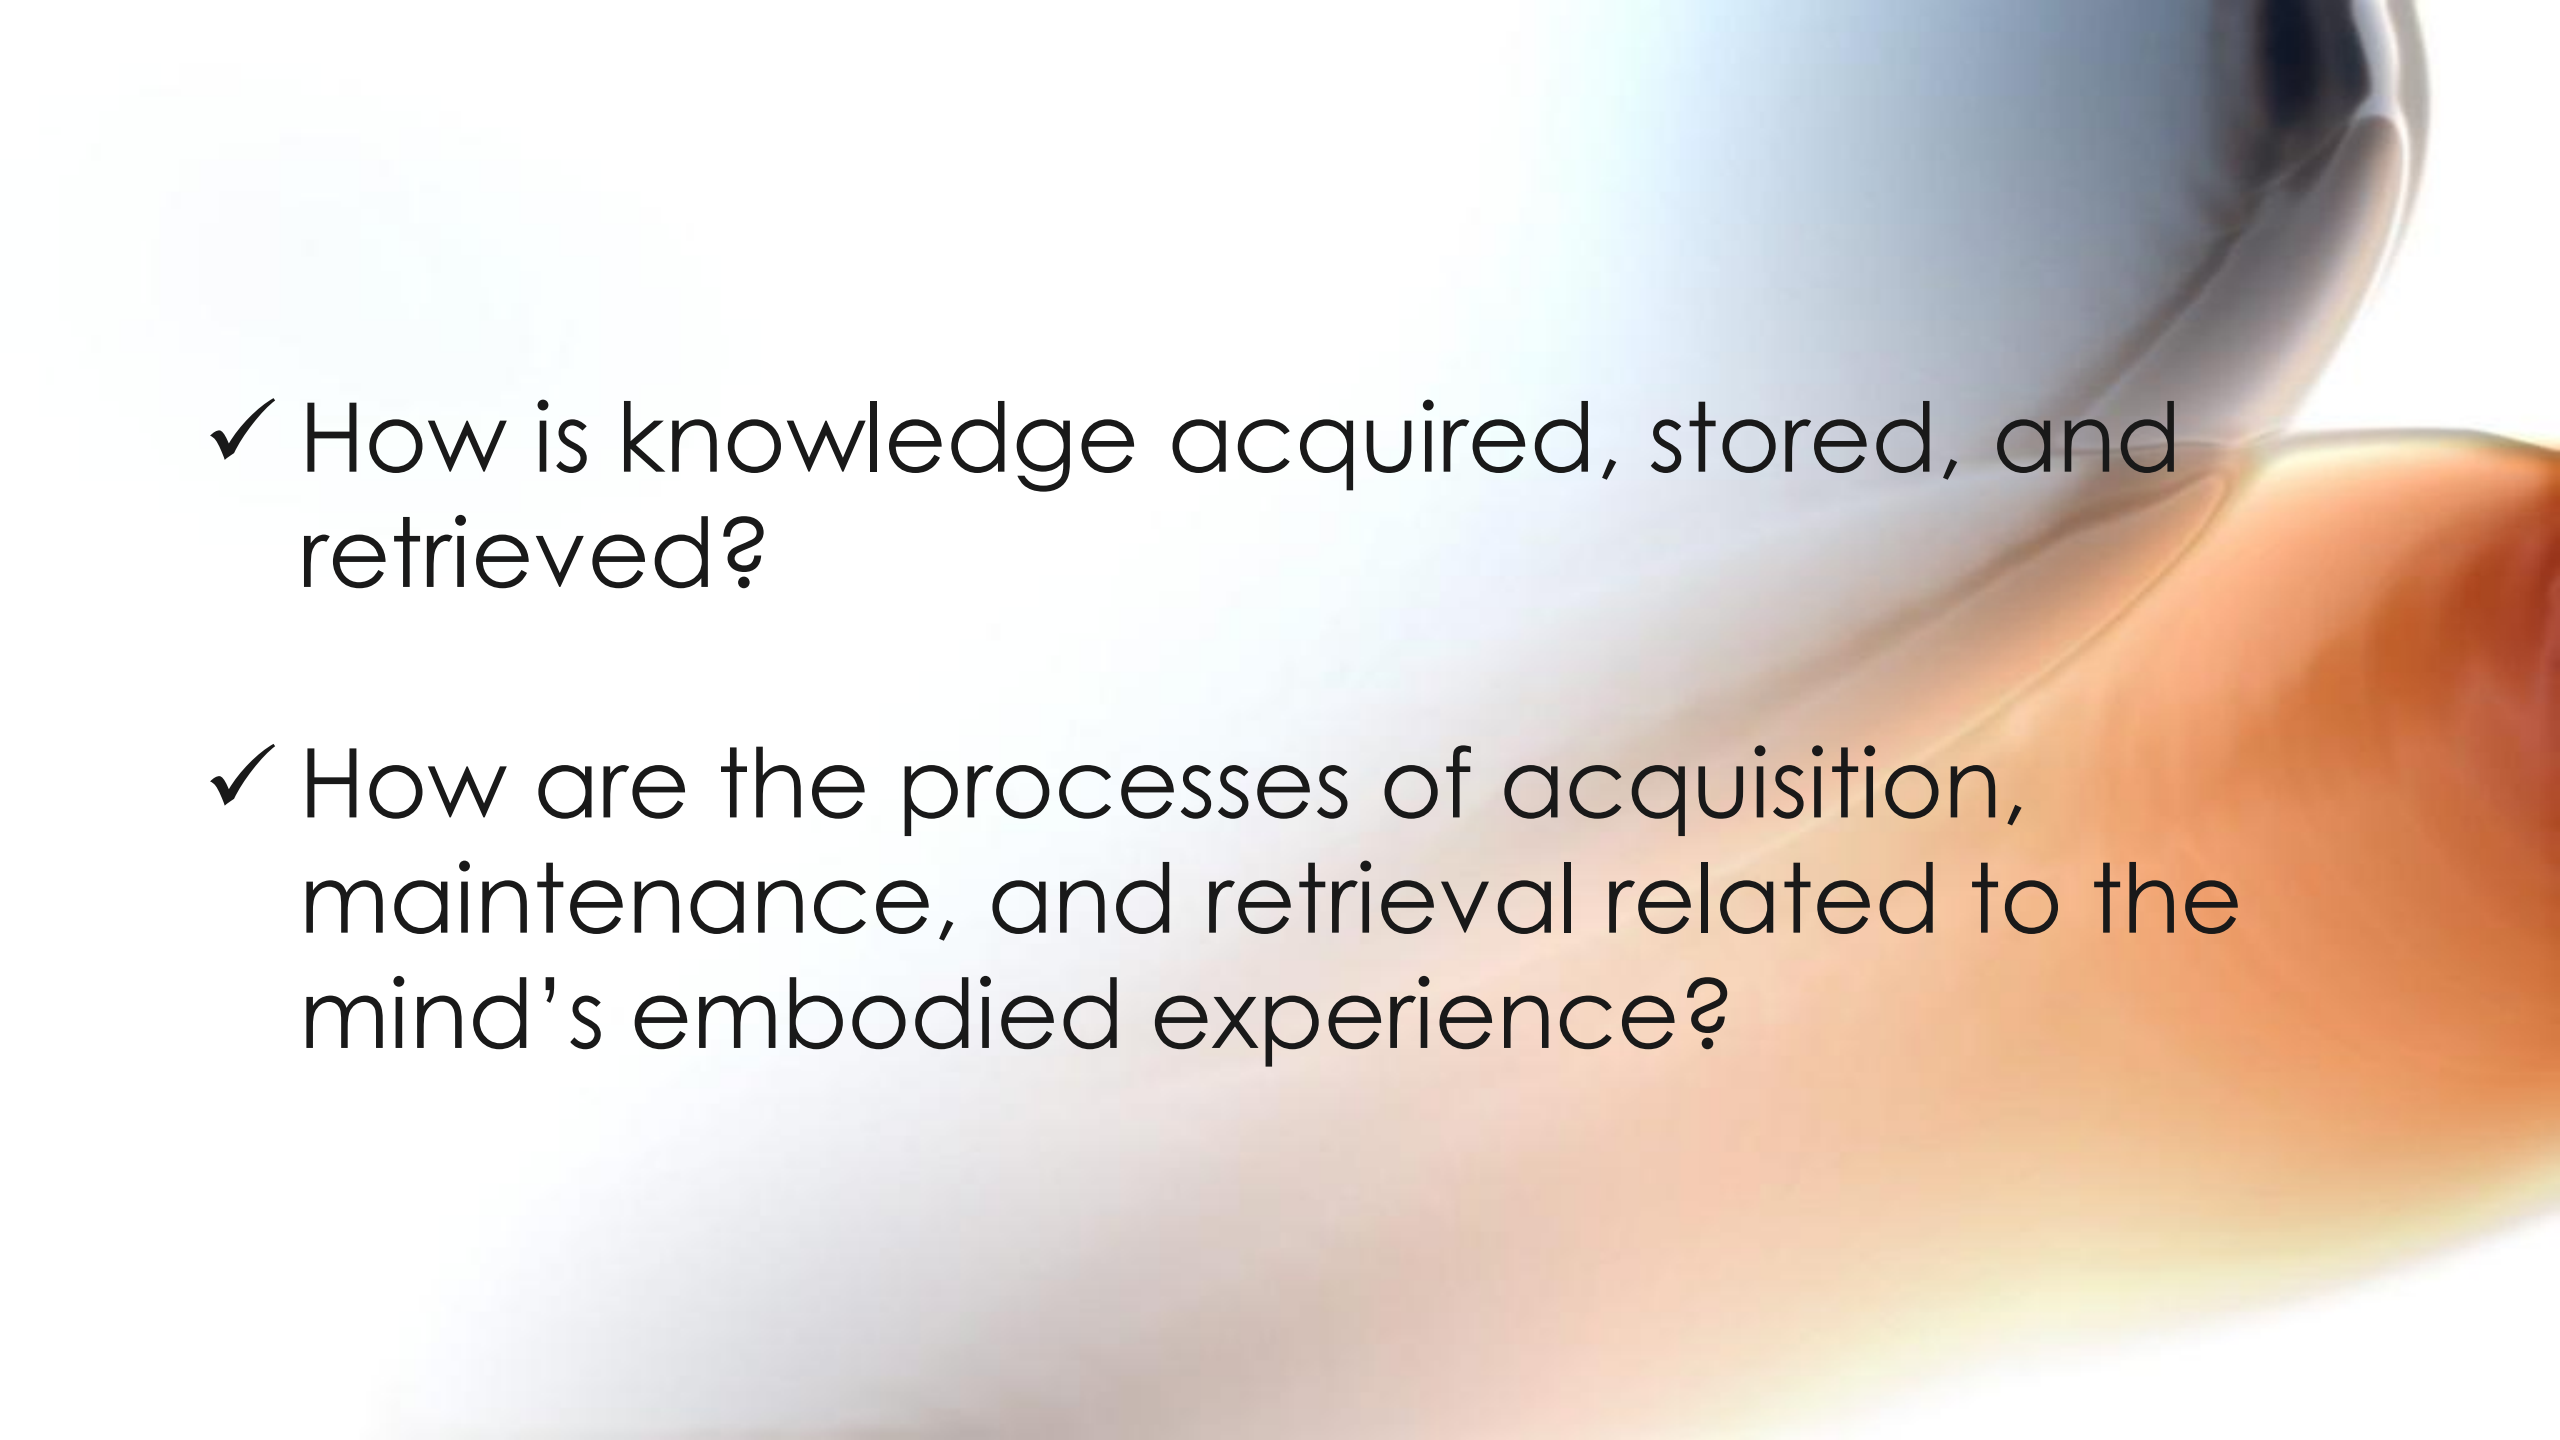

1. SIMULATED COGNITION

2. VISUOSPATIAL BIASES IN
KNOWLEDGE
REPRESENTATIONS

3. INTERACTIONS BETWEEN CO-
ACTIVATED REPRESENTATIONS

- 
- ✓ How is knowledge acquired, stored, and retrieved?
 - ✓ How are the processes of acquisition, maintenance, and retrieval related to the mind's embodied experience?

Cognition and Experience

- Perceptual state (auditory, visual, etc)
- Motor state (action)
- Affective state (emotion)

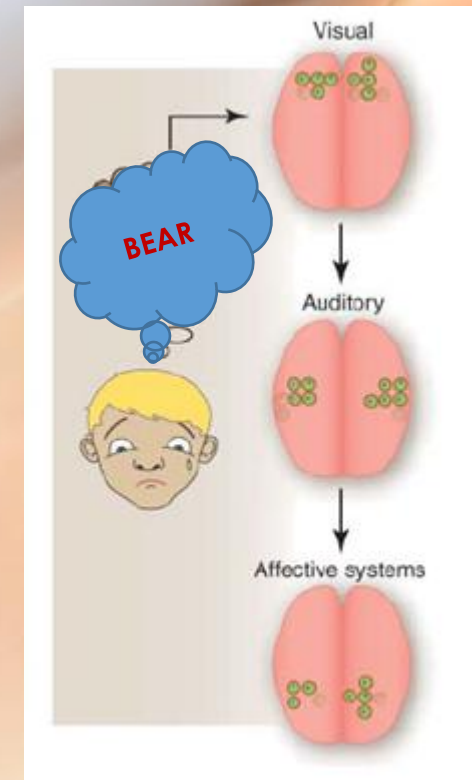

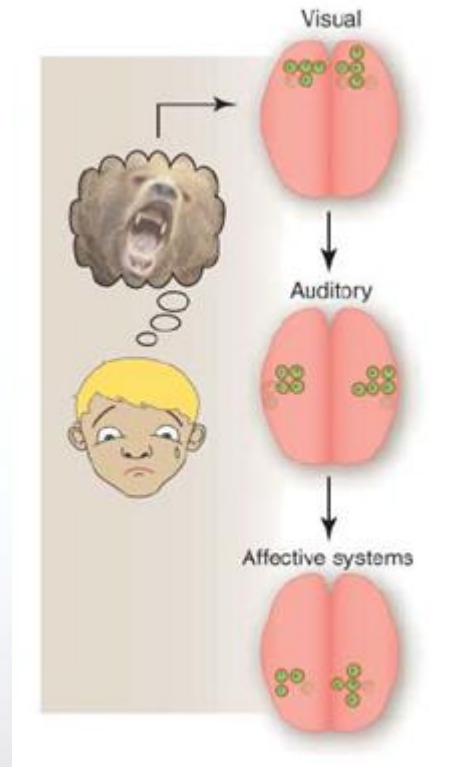

Propositional Meaning in the Brain

(e.g. Decartes 1664; Fodor & Pylyshyn 1981; Pylyshyn 2009).

Simulated Meaning in the Brain

“Simulation is the *re-enactment* of *perceptual*, motor, and introspective states acquired during experience with the world, body, and mind”
(Barsalou 2008)

Simulation Sources

(Myachykov, et al., 2013, TOPICS)

- ✓ Tropism (in Botantics, *Tropism* refers to the changes in an organism in response to an external stimulus)
 - Tropic effects include the representational features that reflect the organization and nature of the physical world we live in (source of light, gravity, etc.)

- ✓ Embodiment
 - Embodied effects include the representational features that reflect the organization and nature of our physical bodies (upward posture, frontal binocular vision, upper limbs for manipulation, etc.)
 - Embodied effects can be general and individually specific.

- ✓ Situated context
 - Situated effects include the representational features that emerge from variable contexts – social, cultural, perceptual, educational, etc.

Simulation Modalities

✓ Sensory

- Sensory effects include the representational features that reflect the perceptual history of the concept (more = up, louder; right = positive, etc.)
- Sensory effects correspond to sensory modalities: visuospatial, auditory, haptic, olfactory, gustatory, proprioceptive.

✓ Motor

- Motor effects include the representational features that reflect the motor history of the concept (affordances, other effects associated with specific effectors)

✓ Physiological

- Physiological effects include the representational features that reflect the history of physiological state(s) associated with the concept – heart beat, temperature, arousal, etc.

✓ Introspective

- Complex states including mindfulness, meditation, etc.

1. SIMULATED COGNITION
- 2. VISUOSPATIAL BIASES IN KNOWLEDGE REPRESENTATIONS**
3. INTERACTIONS BETWEEN CO-ACTIVATED REPRESENTATIONS

Visuospatial Biases in Knowledge Representations

progress

Horizontal Biases in Spatial Semantics

(Chapman & Myachykov *in prep*)

DESIGN

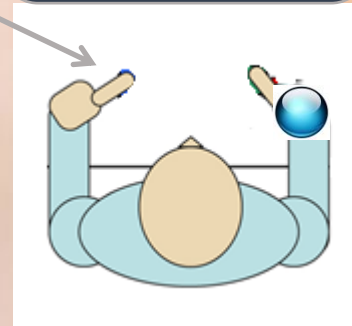

SPATIAL BIAS

RESPONSE

	<i>left</i>	<i>right</i>
<i>left</i>	congruent	incongruent
<i>right</i>	incongruent	congruent

MATERIALS

<i>left</i>	<i>right</i>
<i>retreat</i>	<i>advance</i>

Verb Bias x Probe Location

$F(1,23)=6.189, p=.023$

- ✓ Understanding verbs of spatial semantics orients attention

Horizontal Space in Numbers

nine

SNARC

(Spatial-Numerical Association of Response Codes)

(Dehaene et al 1993)

	Odd or Even?	
	Left Hand	Right Hand
Block 1	Even	Odd
Block 2	Odd	Even

- **Parity task:** Press right for “odd”, left for “even”.

SNARC

(Dehaene et al 1993)

	Odd or Even?	
	Left Hand	Right Hand
Block 1	Even	Odd
Block 2	Odd	Even

- **Parity task:** Press right for “odd”, left for “even”.

SNARC

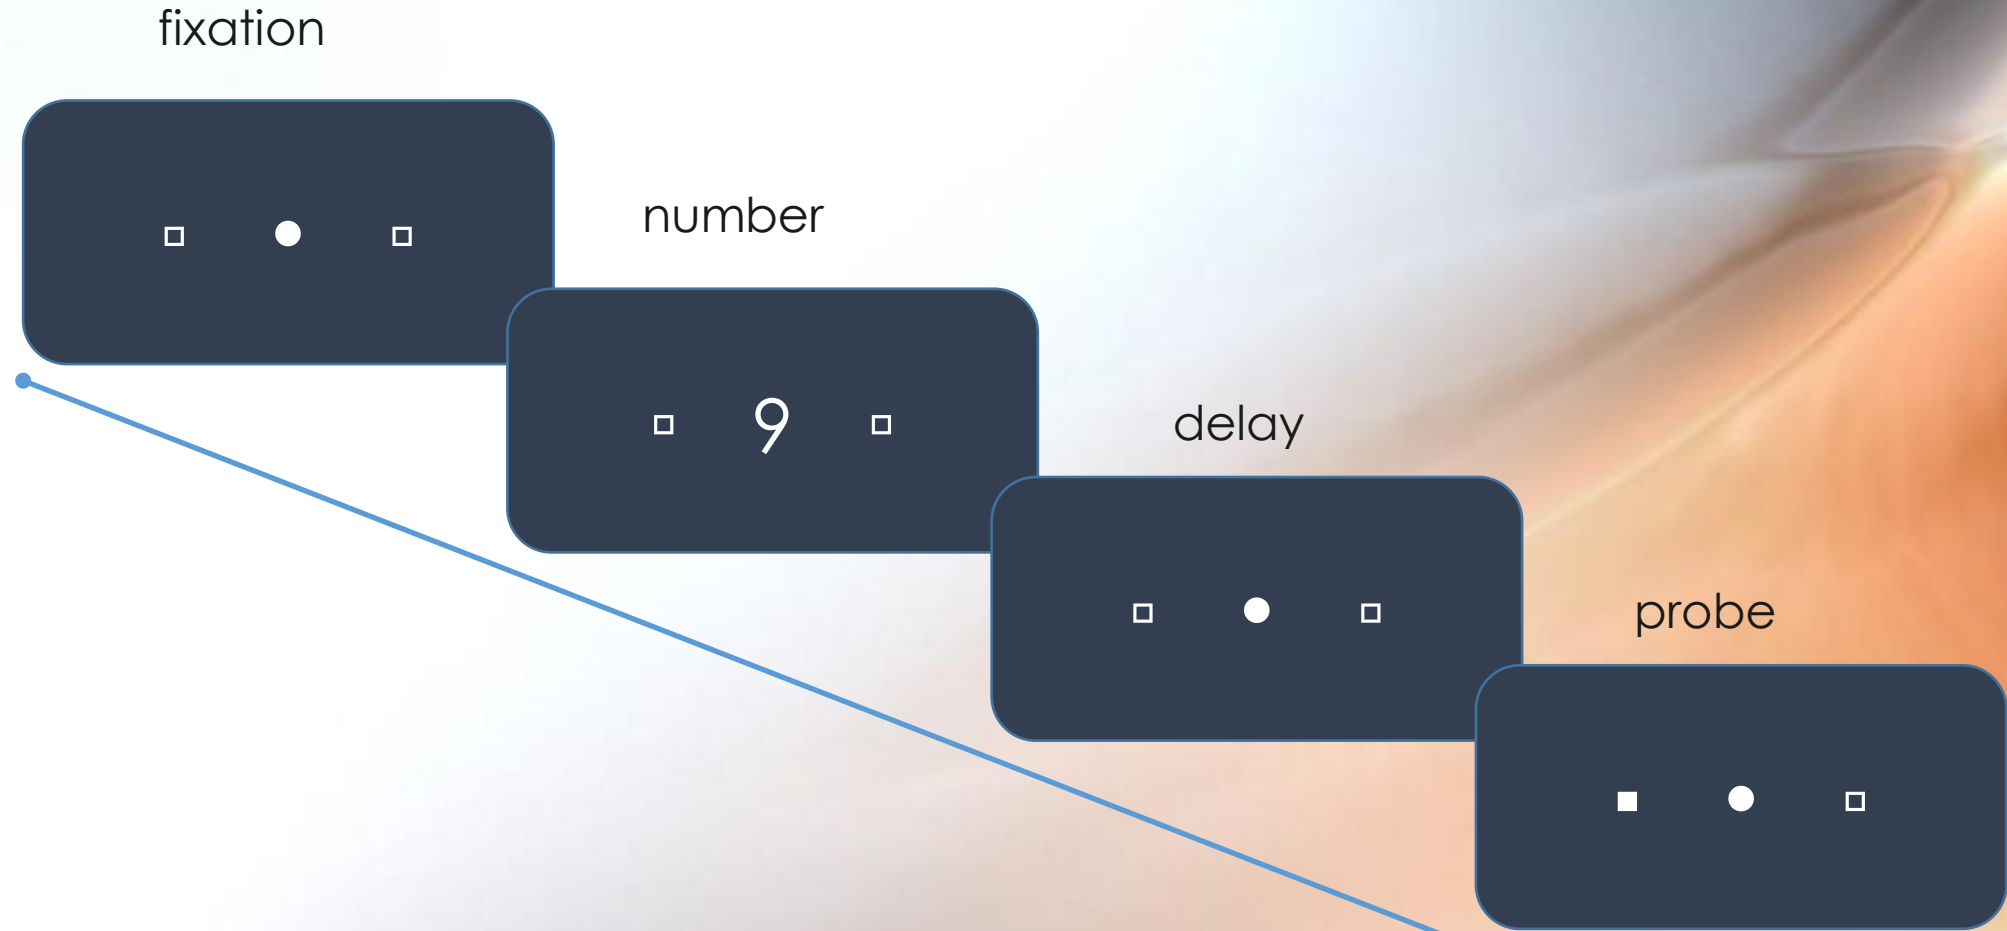

- ✓ People are faster to signal parity of the large numbers with the right-hand, and the small numbers – with the left-hand, responses. Suggests that numbers are perceived as arranged along the MNL.

Stimulus

SNARC and Attention (motor response)

(Fischer et al 2003)

- **Probe-detection task:** *Press the key when detect probe*

SNARC and Attention (motor response)

(Fischer et al 2003)

- ✓ People are faster to detect left probe after small and right probe after large, numbers.

B

SNARC and Attention (eye movements)

(Fischer et al 2004)

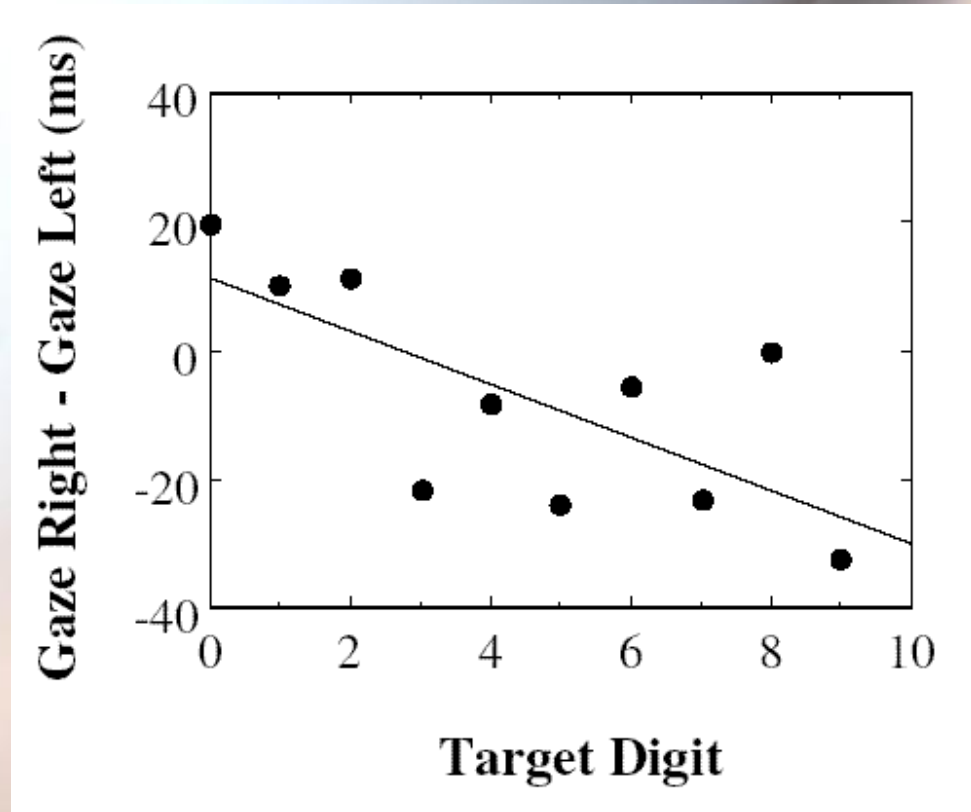

- **Saccade task:** Look left for even, right for odd number

SNARC and Attention (eye movements)

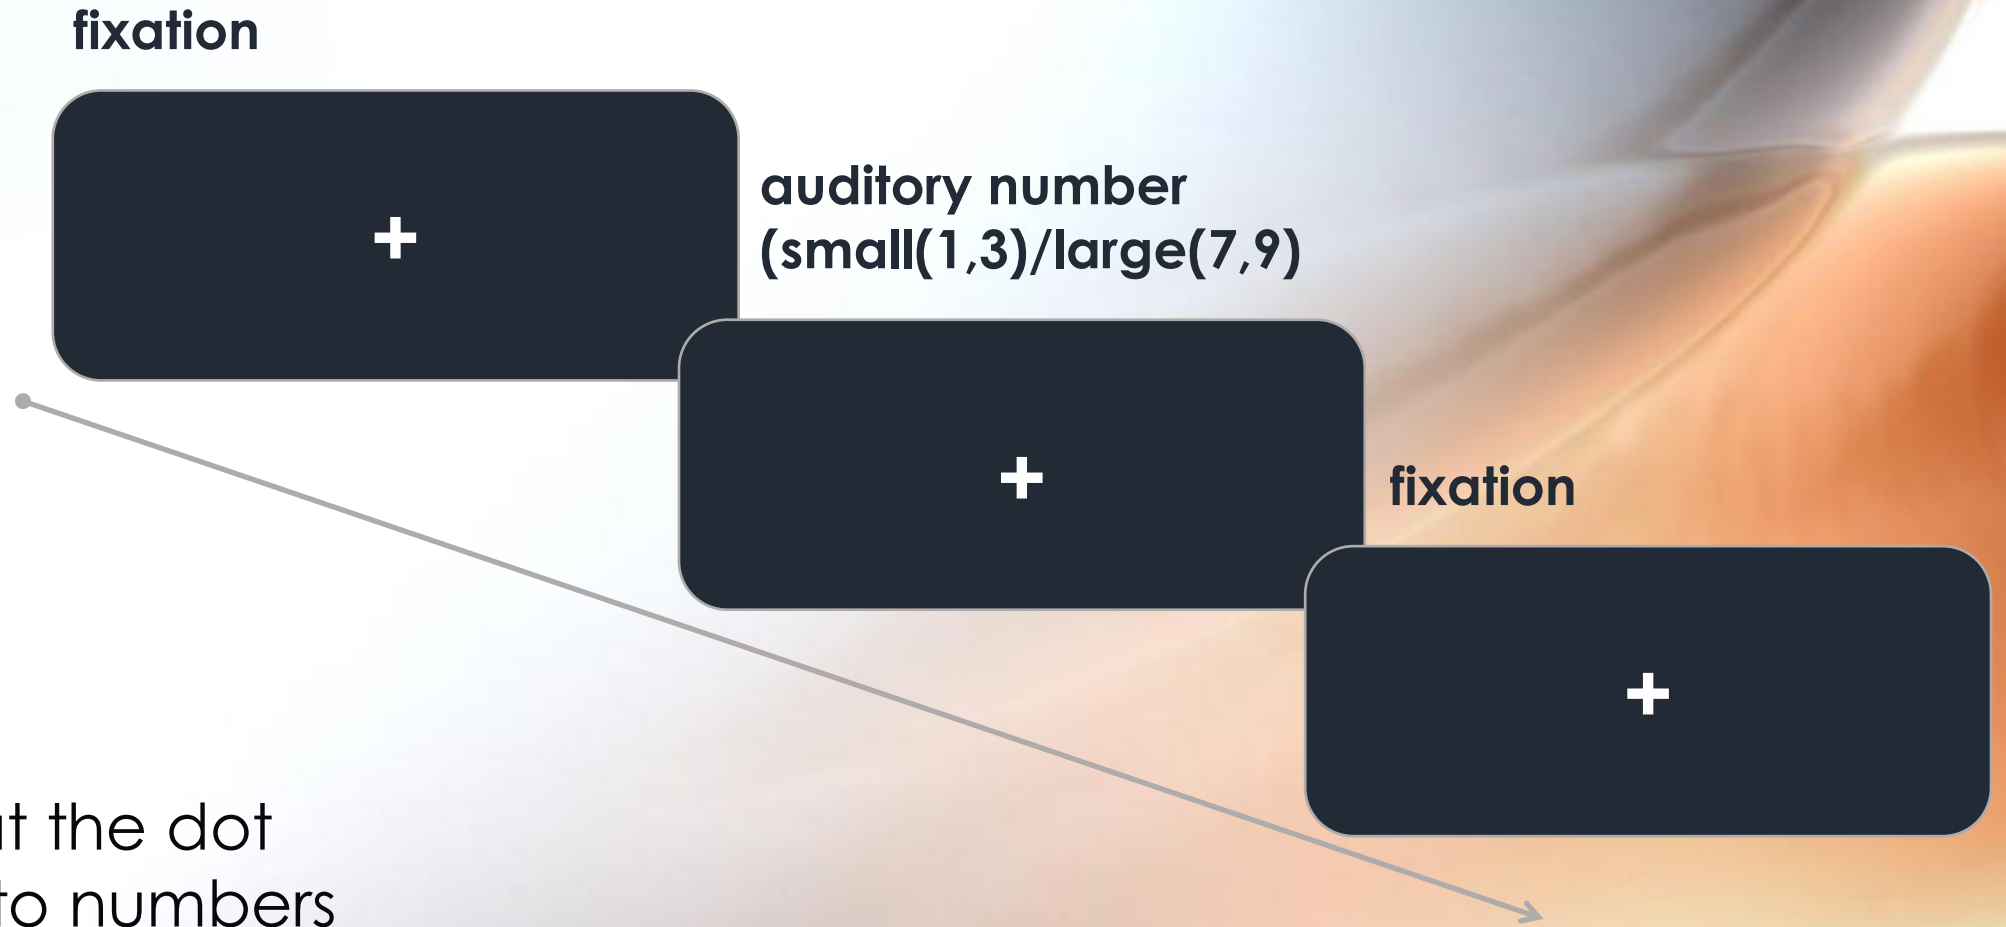

(Fischer et al 2004)

- People are faster to *look* left after small numbers and right – after large numbers

SNARC and Attention (eye movements)

(Myachykov et al 2015 *Acta*; 2016 *PsyRes*)

Task:

- Look at the dot
- Listen to numbers
- Press button when you hear "5"

- ✓ Understanding numerical magnitude automatically orients attention

Random Numbers In Your Head

(Loetscher et al 2008)

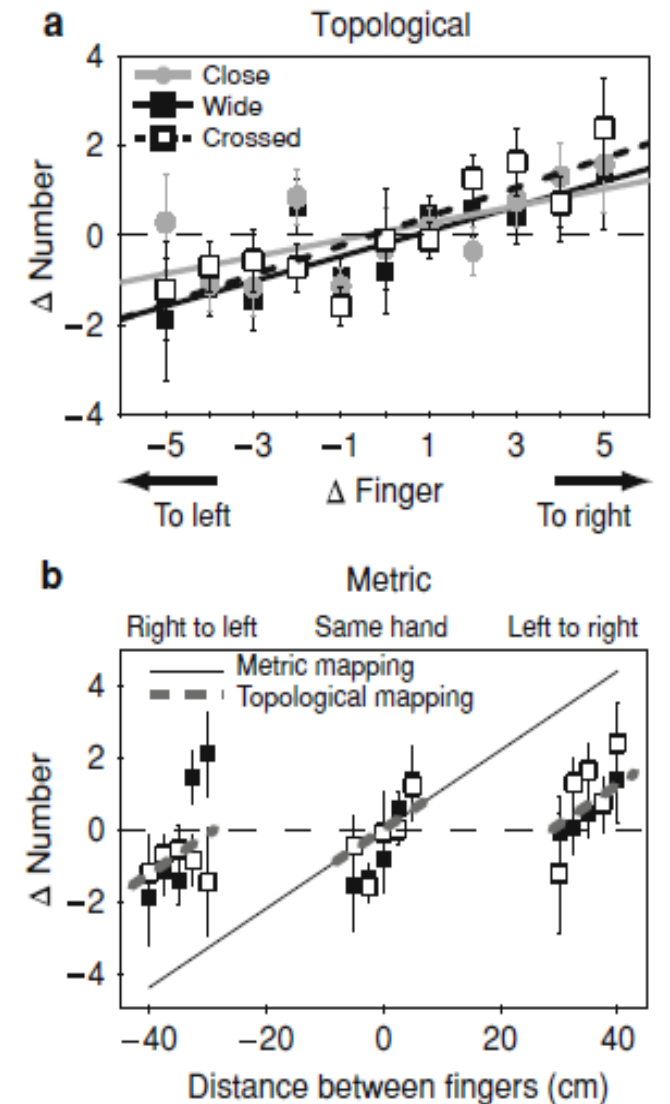

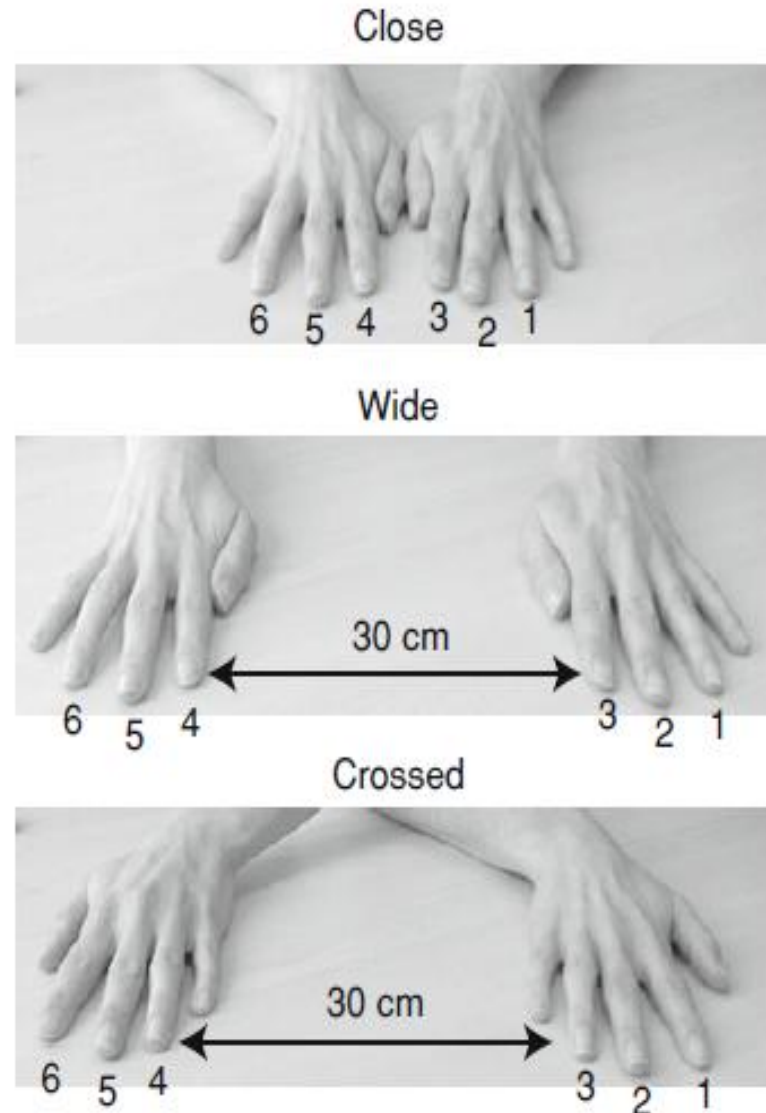

- ✓ People produce larger numbers on right turns, smaller numbers on left turns

Random Numbers In Your Fingers

(Plaisier & Smets 2011)

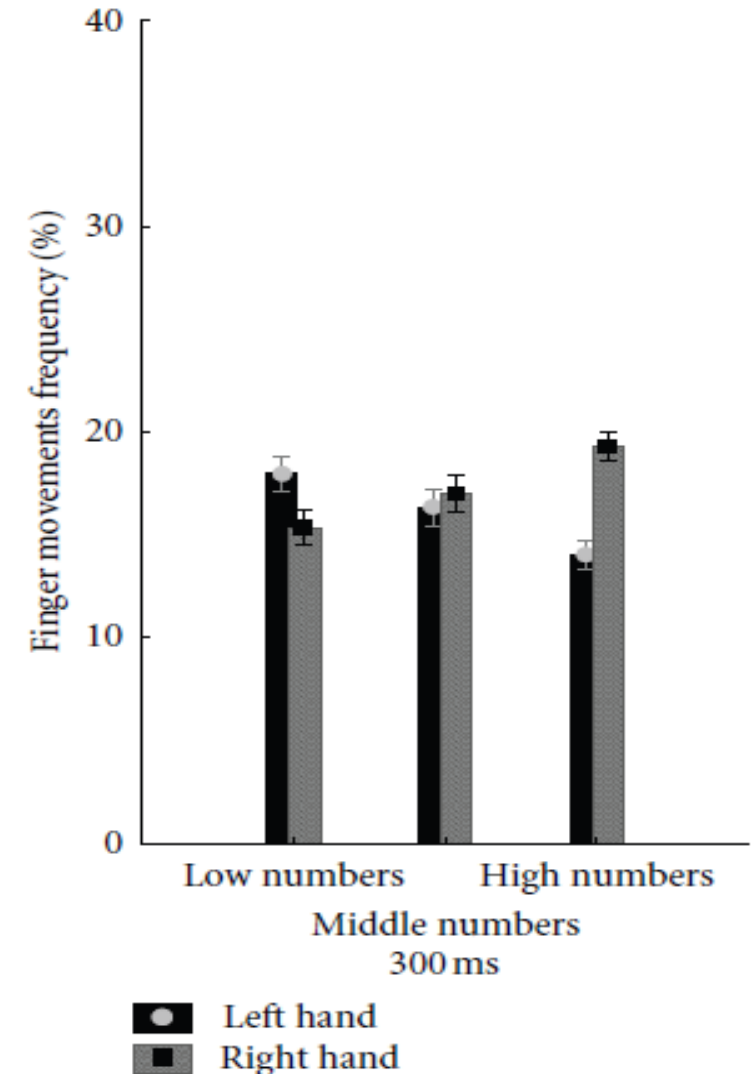

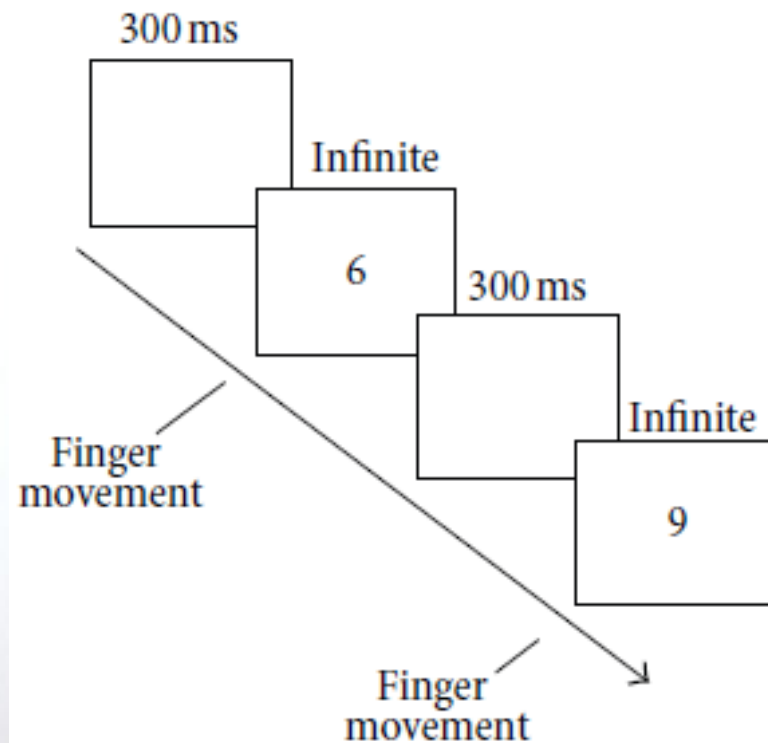

- ✓ Naming a smaller number than the previous one was associated with tapping a finger to the left of the previously tapped finger.

Random Numbers In Your Fingers

(Vicario 2012)

- ✓ Naming a smaller number than the previous one was associated with tapping a finger to the left of the previously tapped finger.

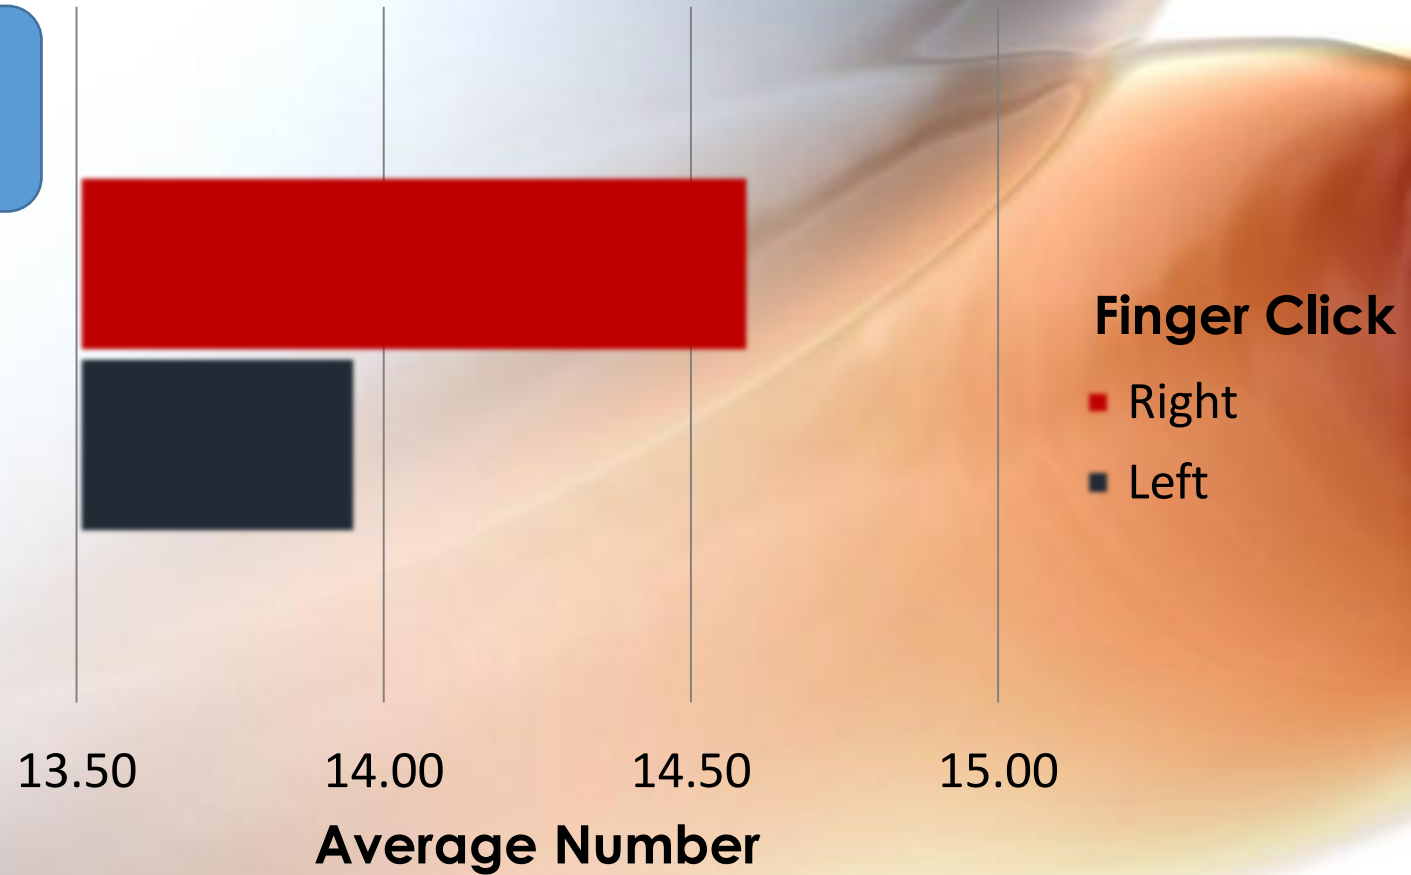

Random Numbers In Your Fingers

(Myachykov, in prep)

1

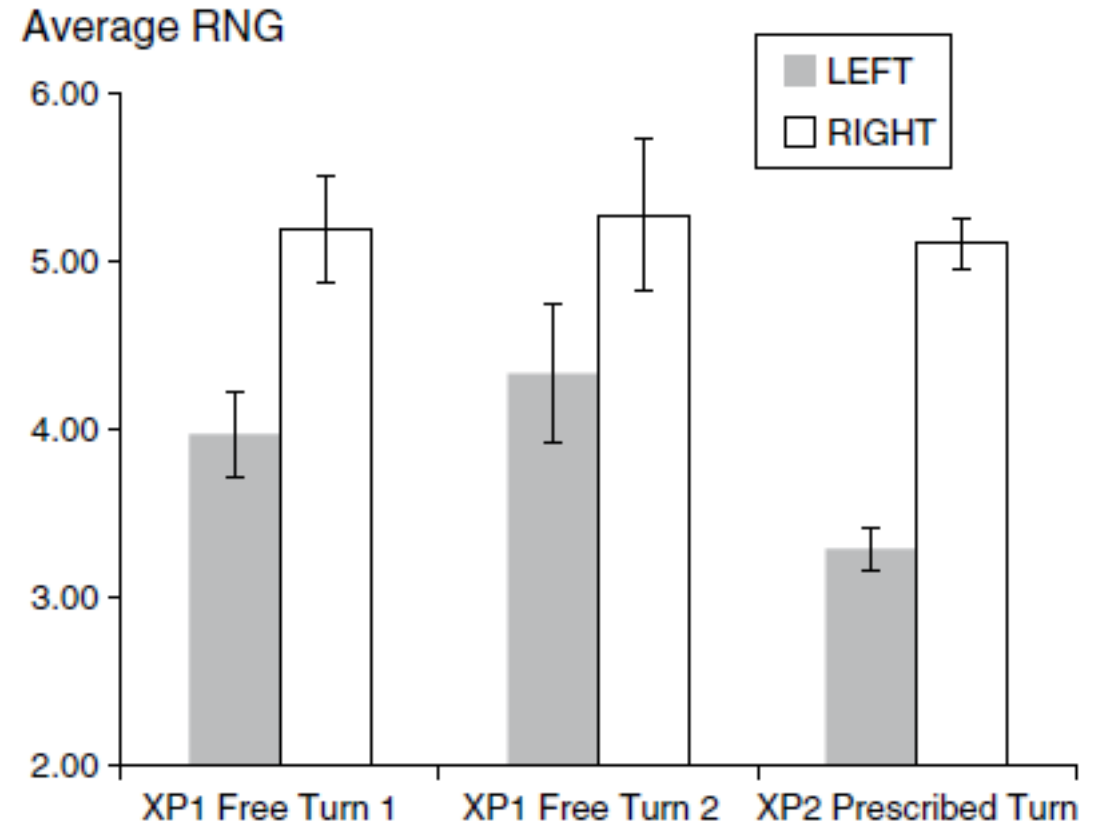

9

Random Numbers In Your Walk

(Shaki & Fischer 2014)

- ✓ People produce larger numbers on rightward walks, smaller numbers on leftward walks.

ATOM: A Theory of Magnitude

(Walsh 2008; 2015)

1. Time, space, number and weight magnitudes are all part of a generalised magnitude system.
2. Concepts other than numbers should show similar spatial biases.
3. Different concepts relying on magnitude should interact.

ATOM: A Theory of Magnitude

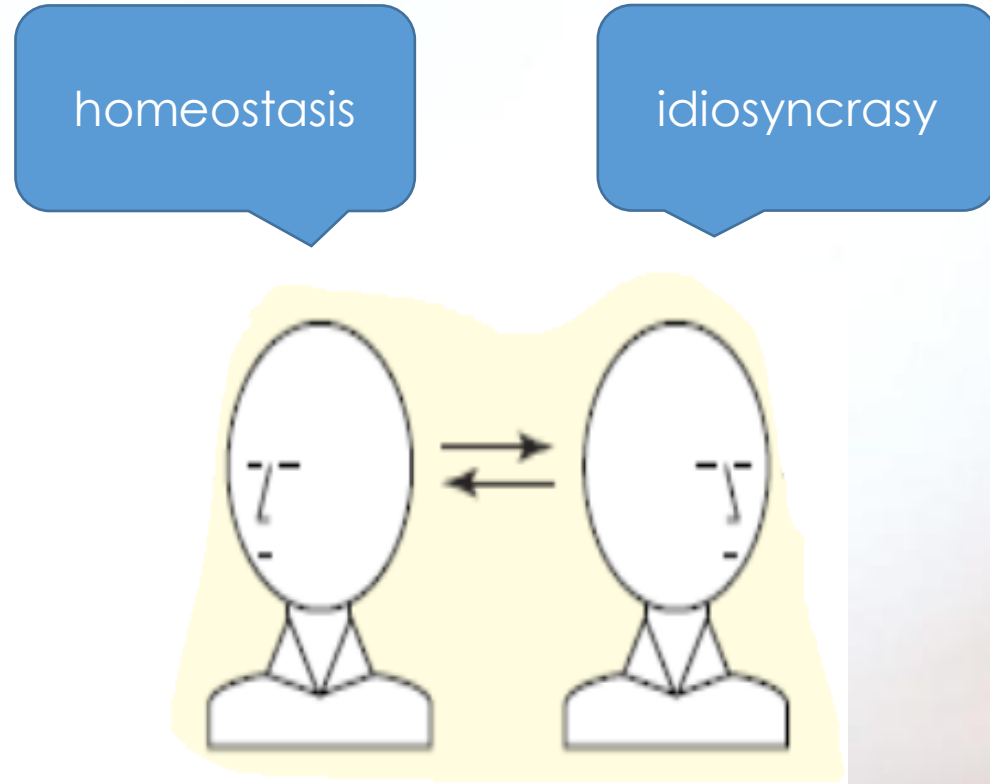

(Walsh 2008; 2015)

1. Time, space, number and weight magnitudes are all part of a generalised magnitude system.
2. Concepts other than numbers should show similar spatial biases.
3. Different concepts relying on magnitude should interact.

Random Words In Your Head

(Myachykov, Chapman, & Scheepers, *in prep*)

Magnitude and Valence in Your Head

Visuospatial Simulation of Time

Magnitude and Time

(Chapman & Myachykov, *in prep*)

DESIGN

SYNTACTIC TIME

	future	past
--	--------	------

small	<i>incongruent</i>	<i>congruent</i>
-------	--------------------	------------------

NUMBER

large	<i>congruent</i>	<i>incongruent</i>
-------	------------------	--------------------

SEMANTIC TIME

	future	past
--	--------	------

small	<i>incongruent</i>	<i>congruent</i>
-------	--------------------	------------------

NUMBER

large	<i>congruent</i>	<i>incongruent</i>
-------	------------------	--------------------

Syntactic Tense x Number Magnitude

$F(1,23)=36.625, p<.001$

✓ Understanding syntactic tense orients attention

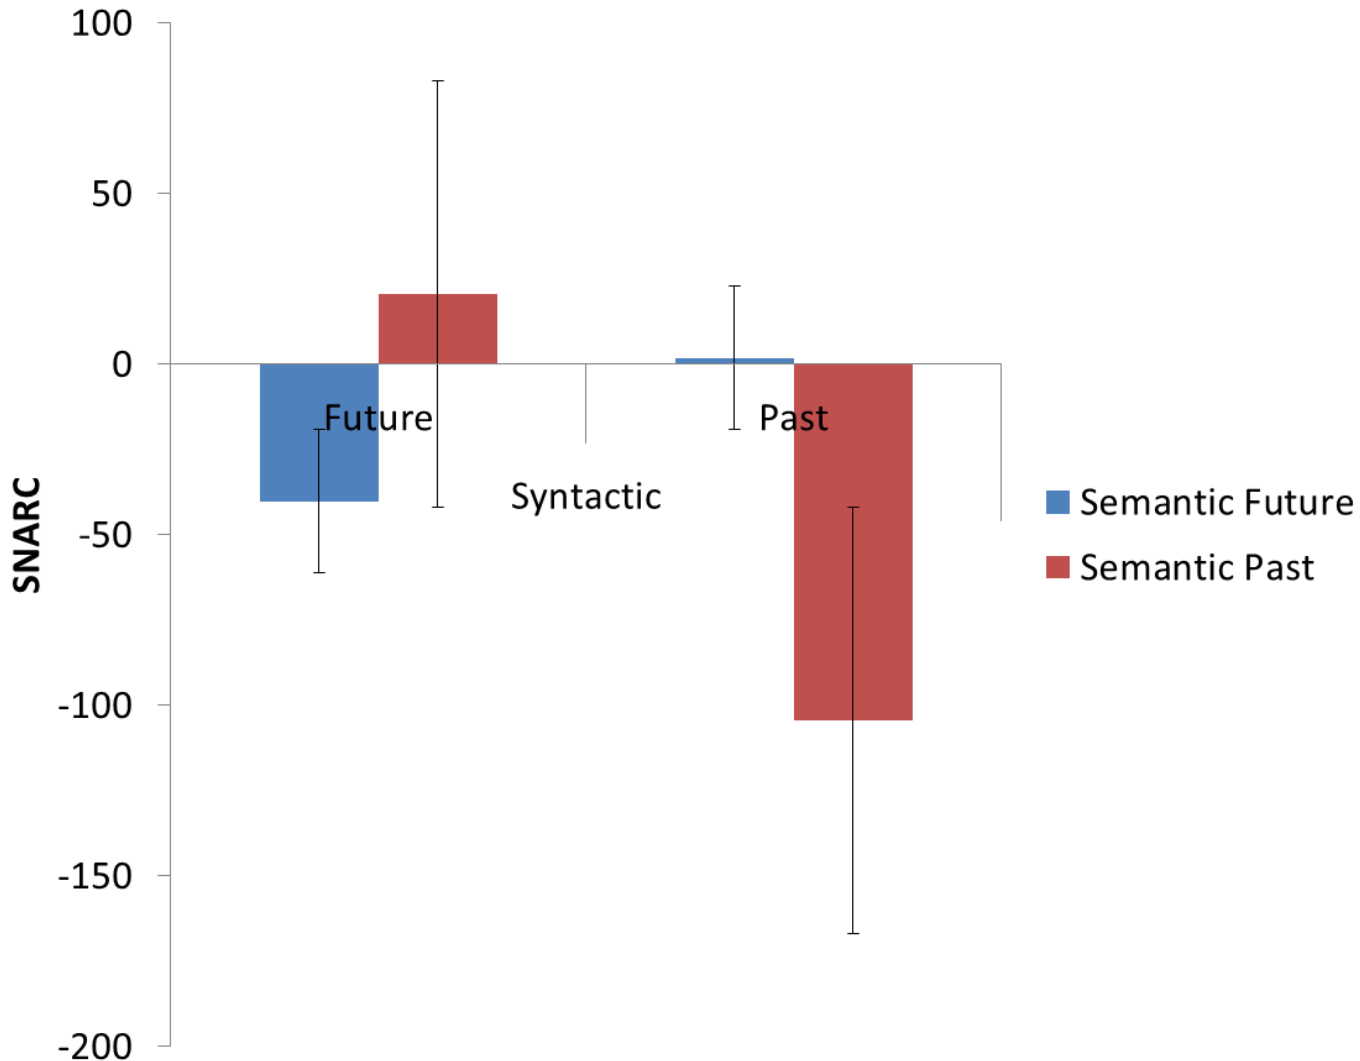

Semantic Time x Number Magnitude

$F(1,23)=30.813, p<.001$

✓ Understanding temporal semantics orients attention

Syntactic Time x Semantic Time

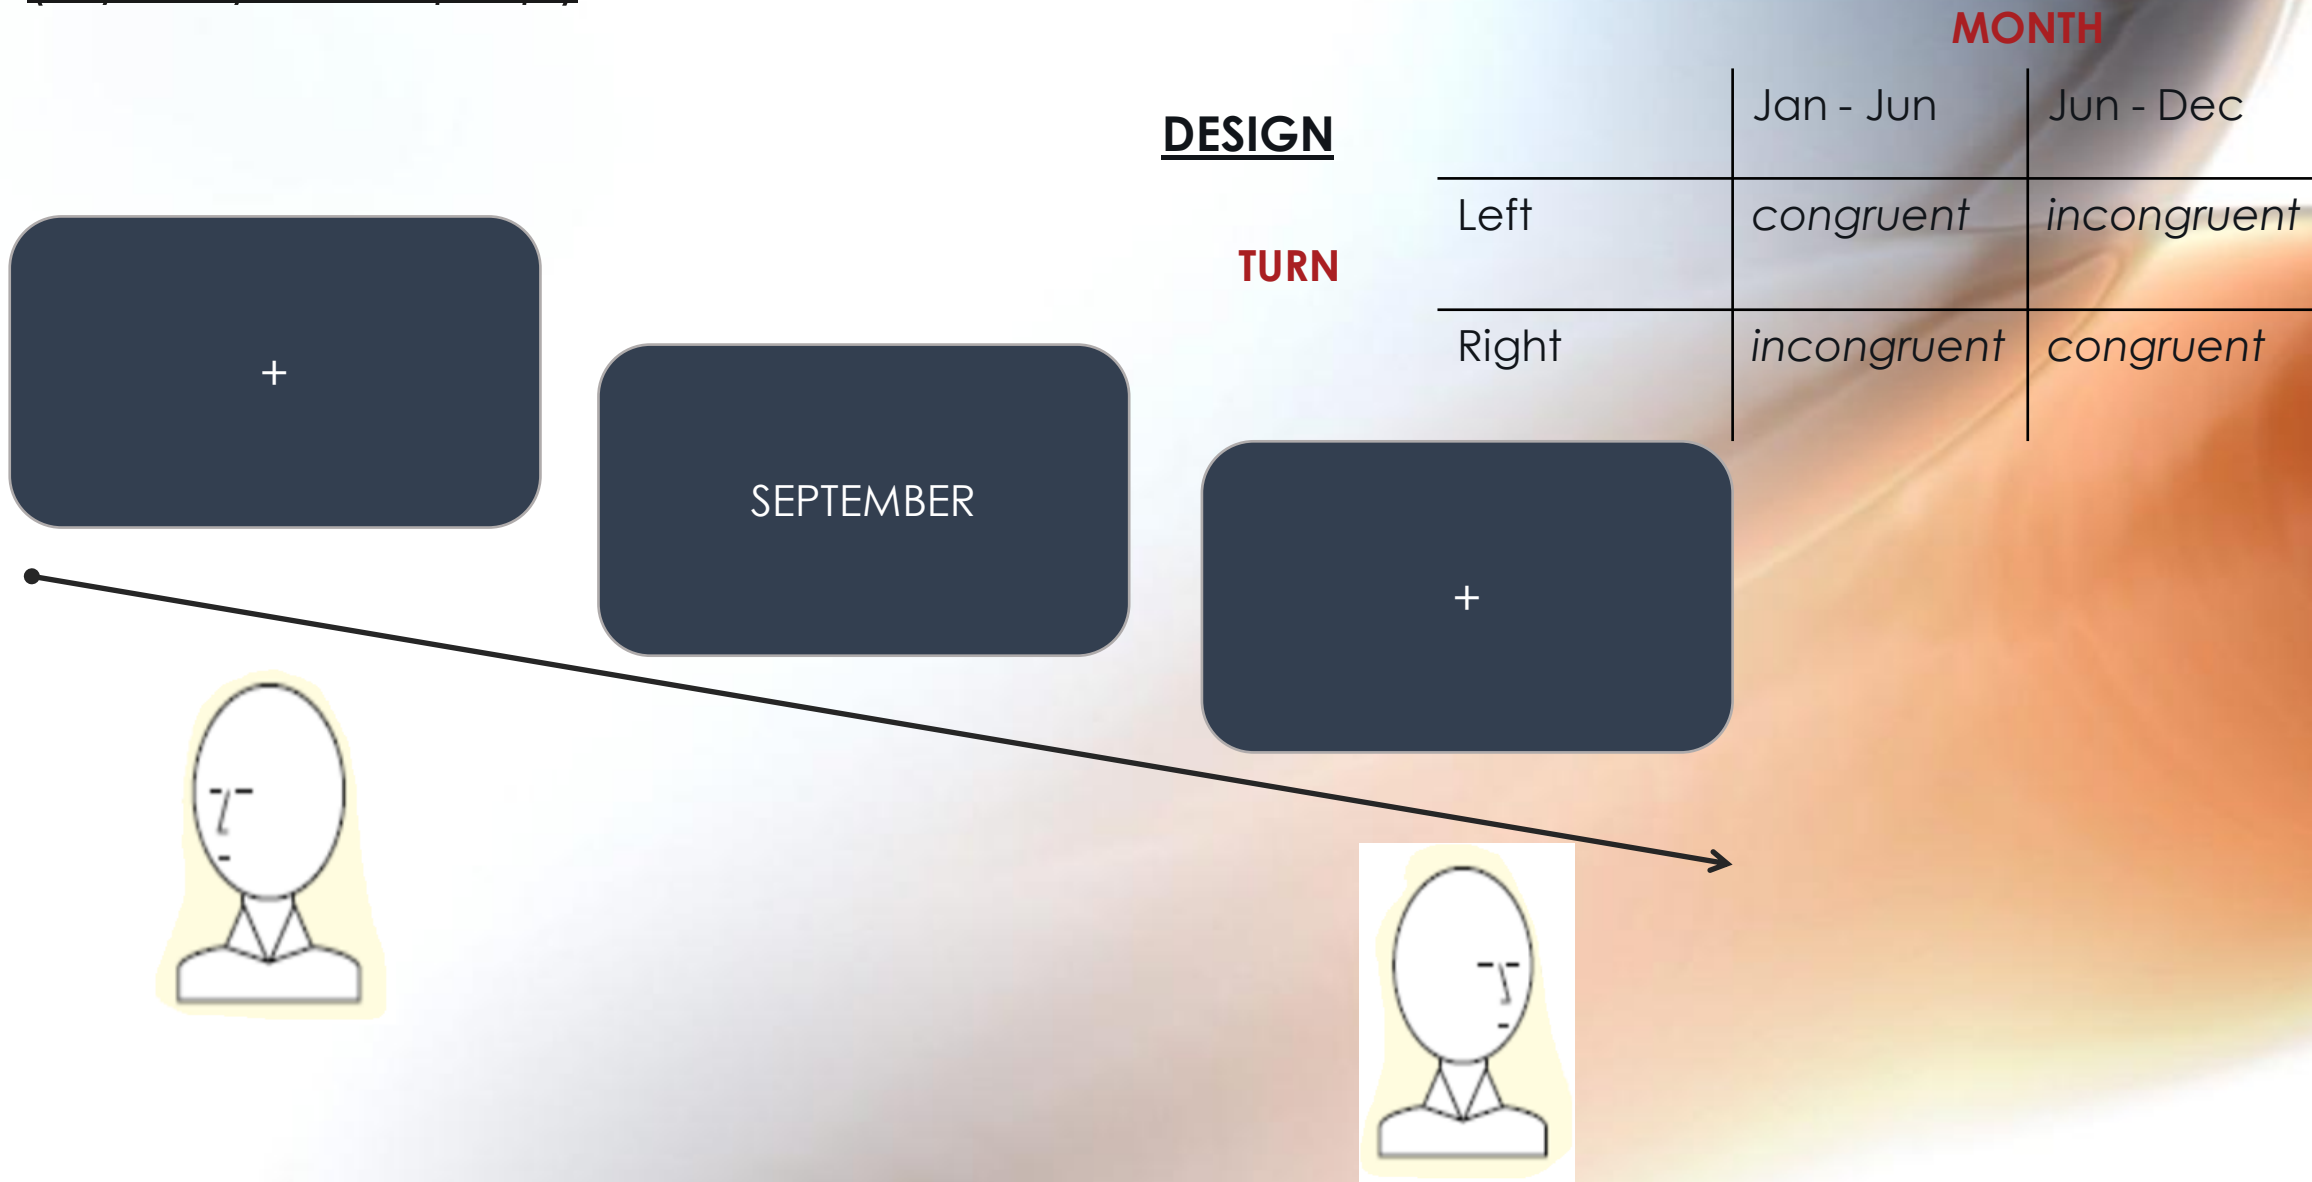

$F(1,23)=3.649, p=.069$

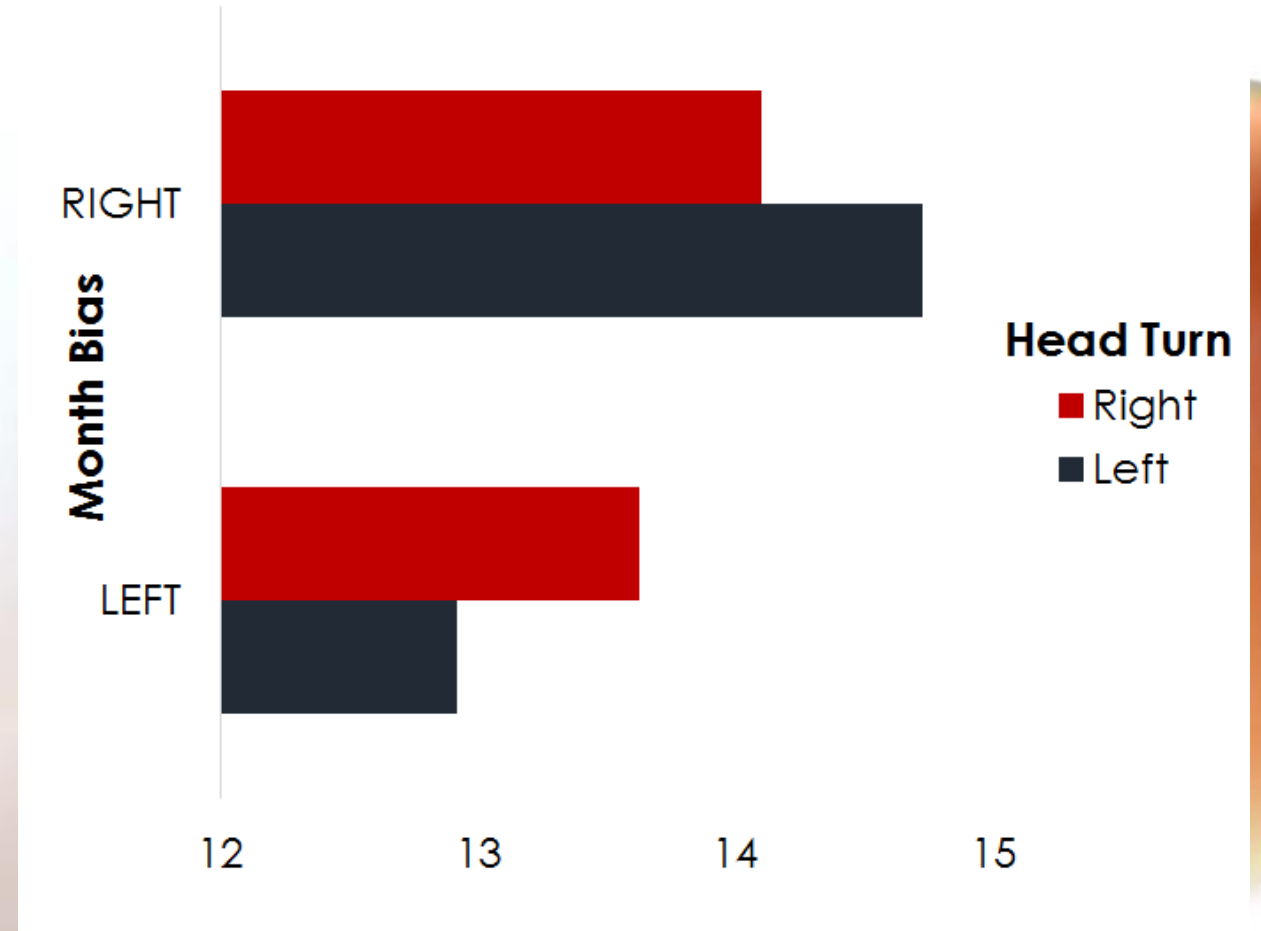

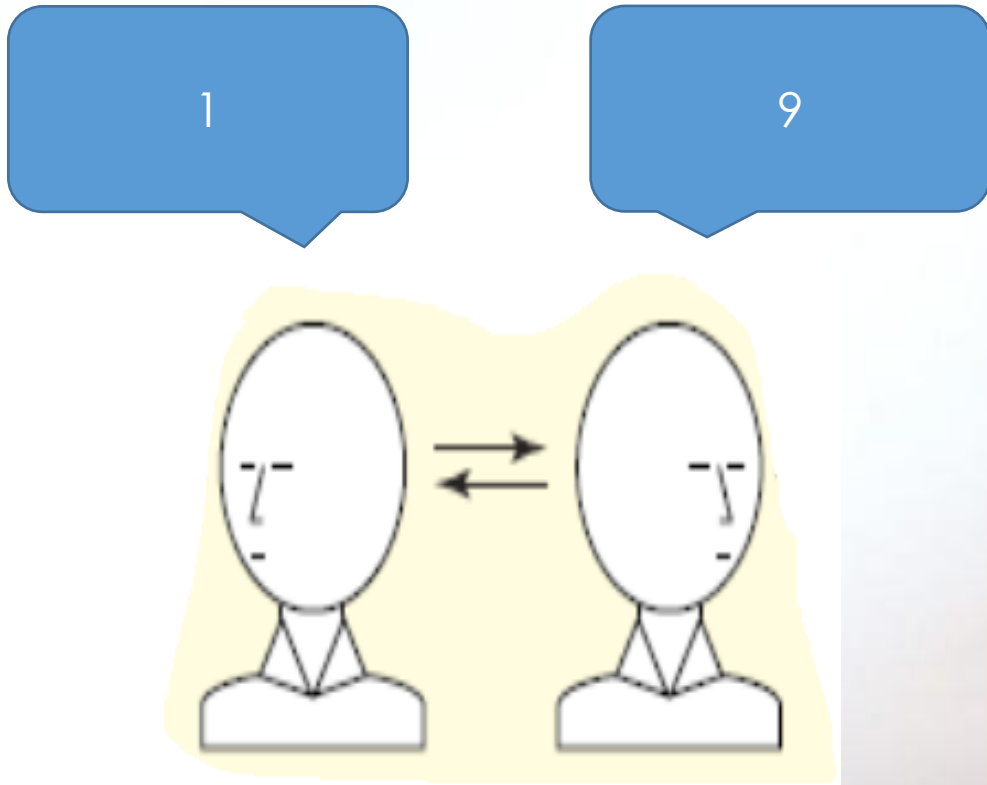

✓ Interaction between syntactic tense x temporal semantics orients attention

Magnitude and Time in Your Head

(Myachykov, in prep)

Magnitude and Time in Your Head

Conclusions

✓ **ACCESSING CONCEPTUAL KNOWLEDGE INVOLVES ACTIVATING ASSOCIATED VISUOSPATIAL BIASES**

- Spatial semantics
- Emotional valence
- Numerical magnitude

✓ **CO-ACTIVATED REPRESENTATIONS INTERPLAY VIA SHARED VISUOSPATIAL BIASES.**

- Numerical magnitude and emotional valence
- Numerical magnitude and time
